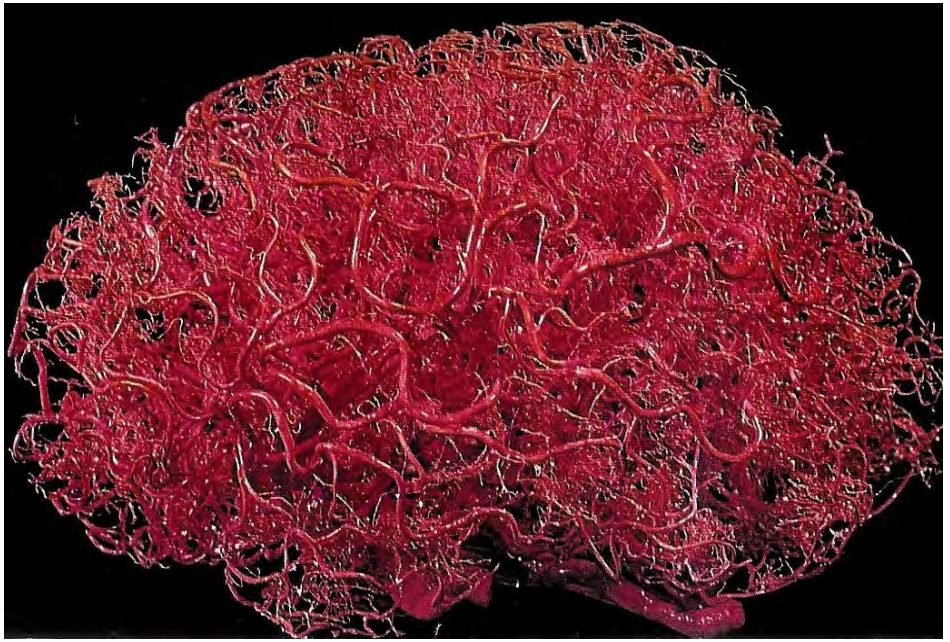
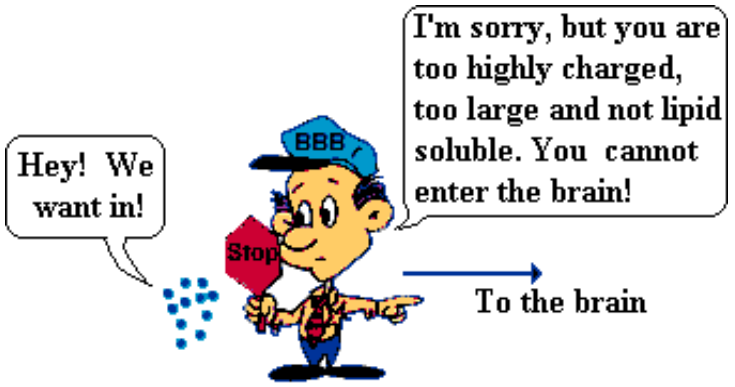
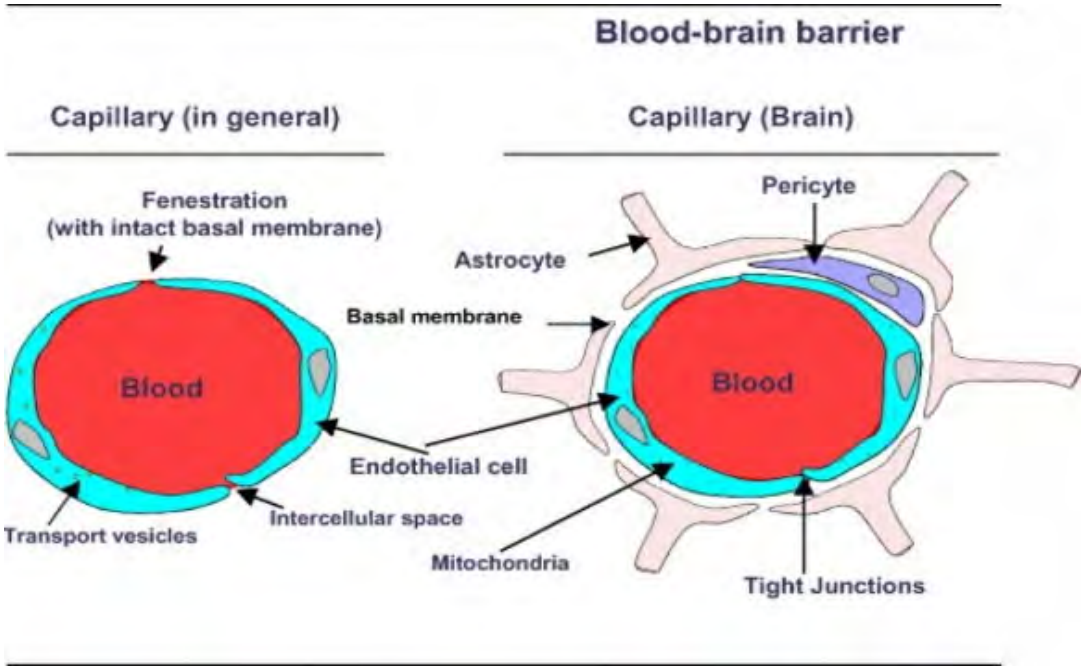
The prediction of drug distribution in the brain is challenging

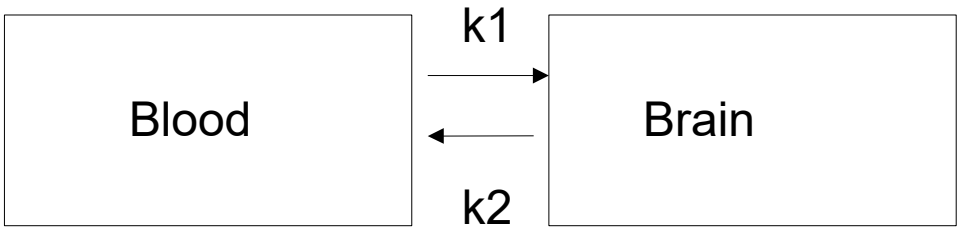


Blood brain barrier (BBB)





Esparza 2015, Standford



BBB

Universiteit Leiden

But there is more than the BBB...

..and many other factors **within** the brain

Universiteit Leiden

Drug distribution within the brain

Spatial variability
Drug distribution over time and space

Universiteit Leiden

Setting up spatial drug distribution model of the brain

Goal:

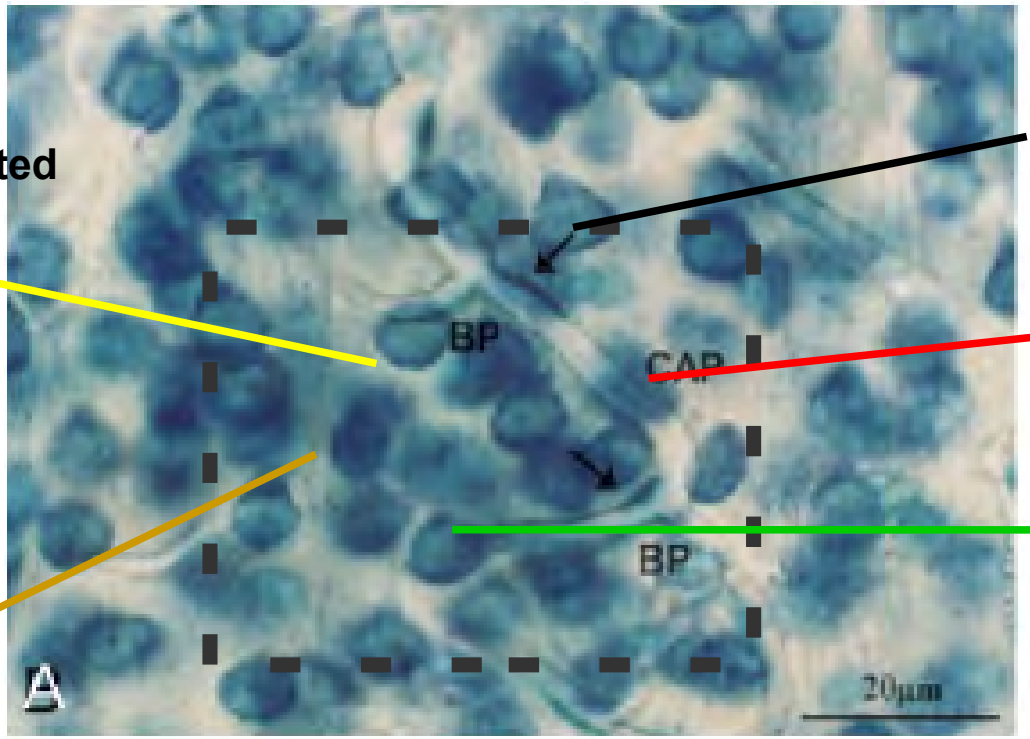
- Understand the **spatial behaviour** of drugs through the brain
- Understand how the **local drug concentration profile** is influenced by which factors

What do we want to model?

Focus on **drug distribution** in **the brain extracellular fluid (ECF):**
1. **Drug transport** in the brain ECF by diffusion and bulk flow
2. **Drug binding** to specific and non-specific binding sites

Unit: smallest building block of the brain in terms of drug distribution

Brain ECF
in which drug is **transported**
by diffusion and bulk flow



Physiological unit.
Approx. 50 x 50 um

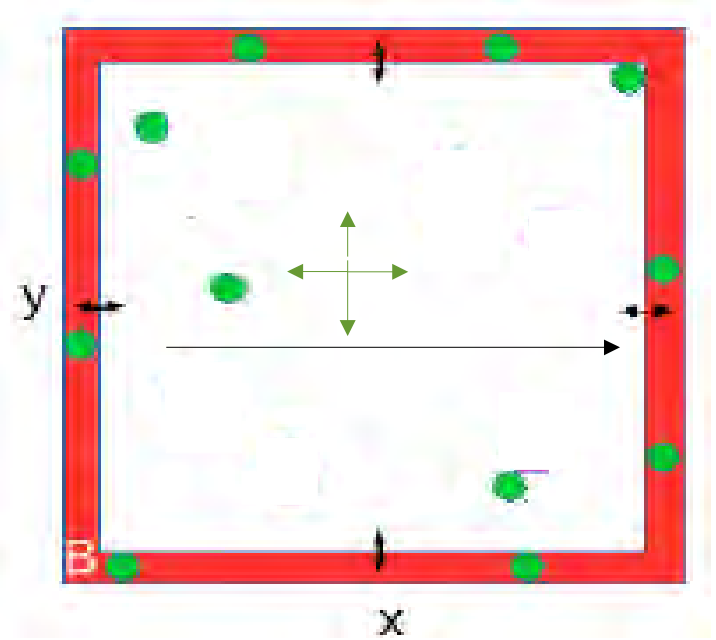
Capillary

Cells, **hinder diffusion** and contain **binding sites**

Blood-brain barrier

A modelled unit – Drug transport

Drug



ECF

BBB

Blood

ECF bulk flow

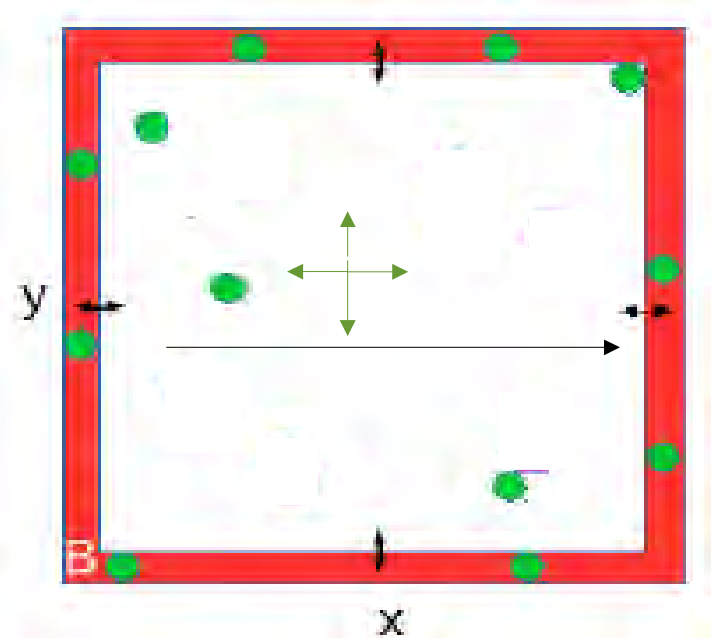
Diffusion

In one unit:

1. Drug is transported in the brain ECF by **diffusion** and **bulk flow**
   Diffusion through the ECF is hindered by **cells,** which are not **explicitly** modelled
   Cells are not explicitly modelled but implicitly as they hinder diffusion
2. Drug distributes by **binding** to specific and non-specific binding sites (see next slide)
   that are **distributed evenly** over the unit
   Cells are not explicitly modelled but implicitly as they contain binding sites

A modelled unit – Drug transport

Drug



ECF

BBB

Blood

ECF bulk flow

Diffusion

$$\frac{\partial C_{ECF}}{\partial t} = \frac{D}{\lambda^2}\nabla^2 C_{ECF} - v\nabla C_{ECF}$$

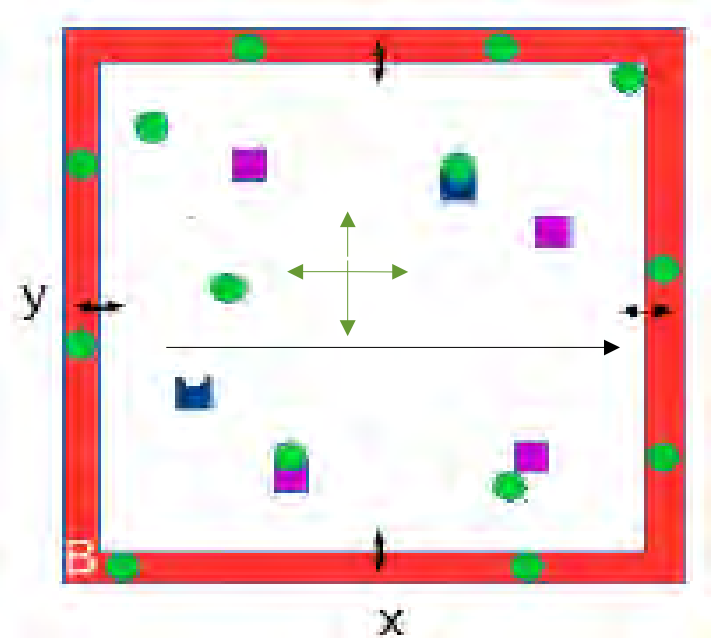
λ = tortuosity = hindrance imposed on diffusion in ECF

A modelled unit – Drug binding

Drug

Receptor

Non-specific binding site



ECF

BBB

Blood

ECF bulk flow

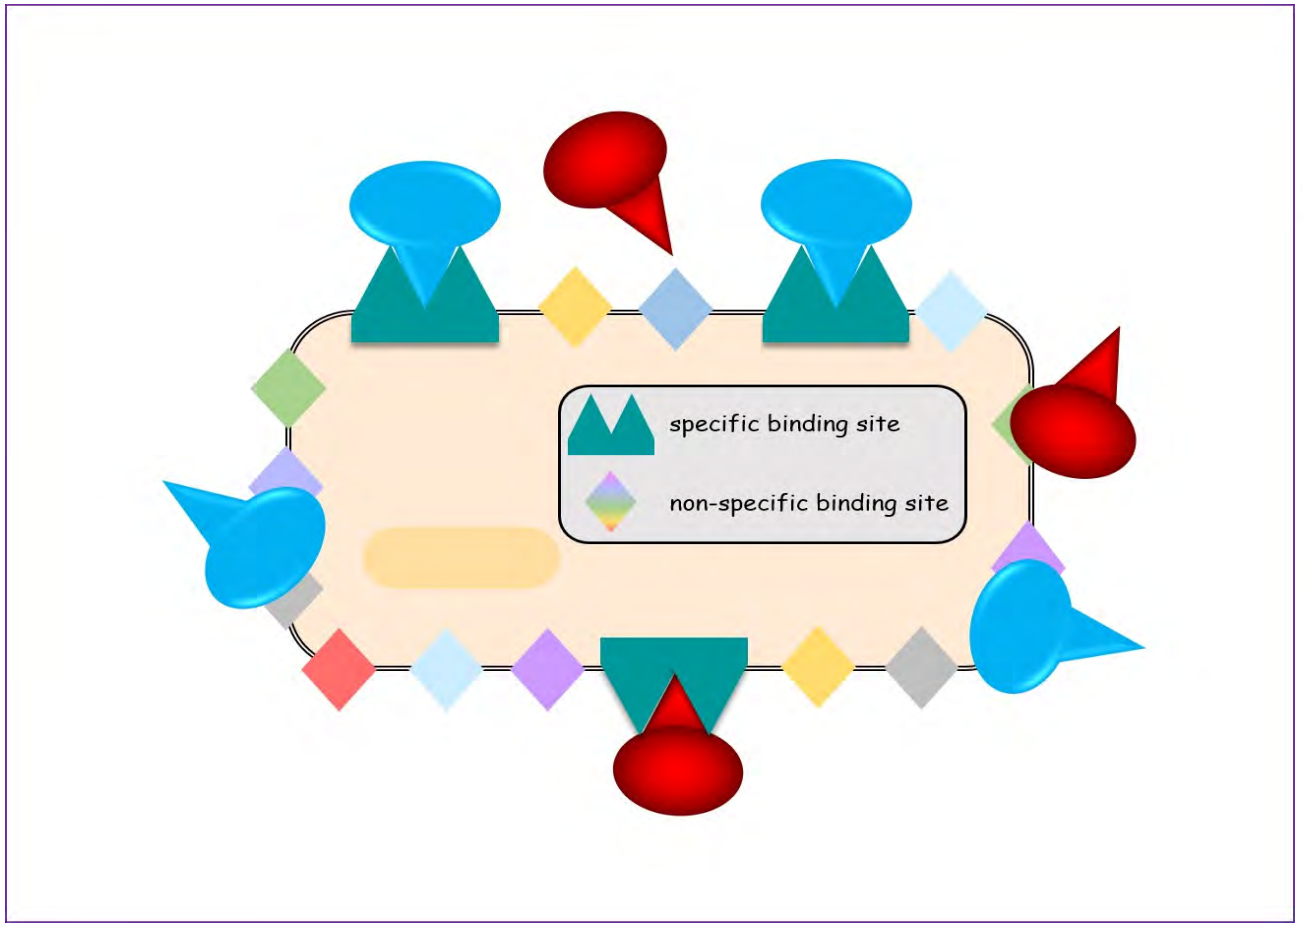
Diffusion

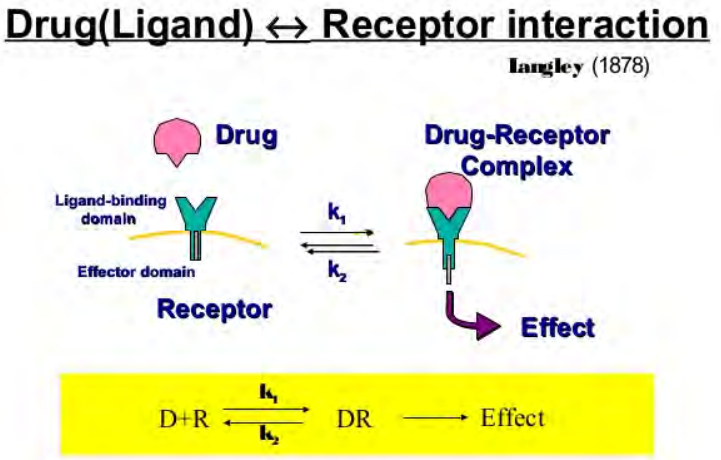
In one unit:

1. Drug is transported in the brain ECF by **diffusion** and **bulk flow**
   Diffusion through the ECF is hindered by **cells**, which are not **explicitly** modelled
   Cells are not explicitly modelled but implicitly as they hinder diffusion
2. Drug distributes by **binding** to specific and non-specific binding sites (see next slide) that are **distributed evenly** over the unit
   Cells are not explicitly modelled but implicitly as they contain binding sites

Drug binding in the ECF

- Drug may bind to and unbind from **targets** that are distributed throughout the ECF
- These targets may be **specific** (wanted) or **non-specific** (unwanted)





Universiteit Leiden

Extending the equation with drug binding

Extend PDE and introduce 2 additional **ODEs** that describe:

1. Concentration change of drug bound to receptors (B_1)
2. Concentration change of drug bound to non-specific binding sites (B_2)

Based on the affinity (association and dissociation constants **K_{on}** and **K_{off}**) of the drug for specific (1) or non-specific (2) binding sites

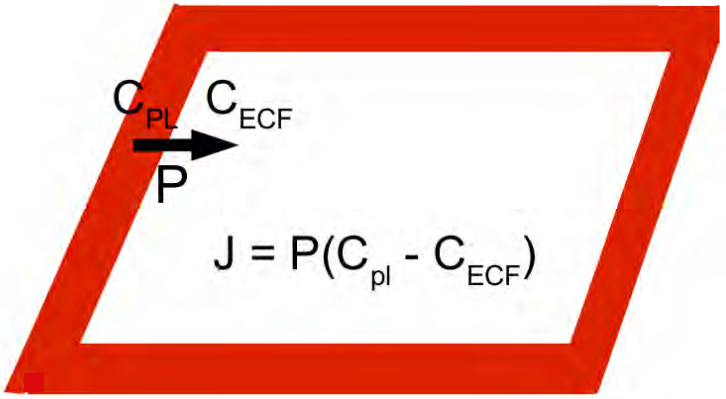
$$\partial \frac{C_{ECF}}{\partial t} = \frac{D}{\lambda^2}\nabla^2 C_{ECF} - v\nabla C_{ECF} - k_{1on}C_{ECF}(B_1^{max} - B_1) + k_{1off}B_1 \\ -k_{2on}C_{ECF}(B_2^{max} - B_2) + k_{2off}B_2 \quad (3)$$

$$\frac{\partial B_1}{\partial t} = k_{1on}C_{ECF}(B_1^{max} - B_1) - k_{1off}B_1 \quad (4)$$

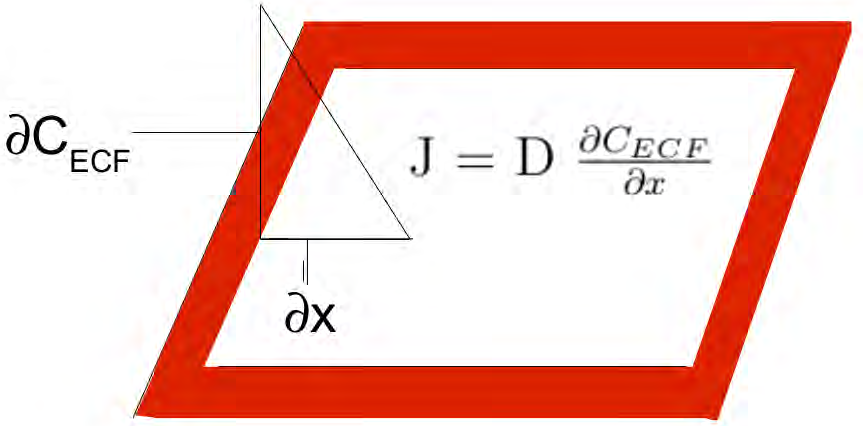
$$\frac{\partial B_2}{\partial t} = k_{2on}C_{ECF}(B_2^{max} - B_1) - k_{2off}B_2, \quad (5)$$

Drug transport through the BBB

Drug enters and leaves the brain extracellular fluid (ECF) from the blood through the BBB, which is described in the **permeability (P)**



Permeability (P)



Fick's law of diffusion

$$D\frac{\partial C_{ECF}}{\partial x} = P(C_{pl} - C_{ECF})$$

for x=0 and x=x_r

$$D\frac{\partial C_{ECF}}{\partial y} = P(C_{pl} - C_{ECF})$$

for y=0 and y=y_l

Universiteit Leiden

Implementation of the model

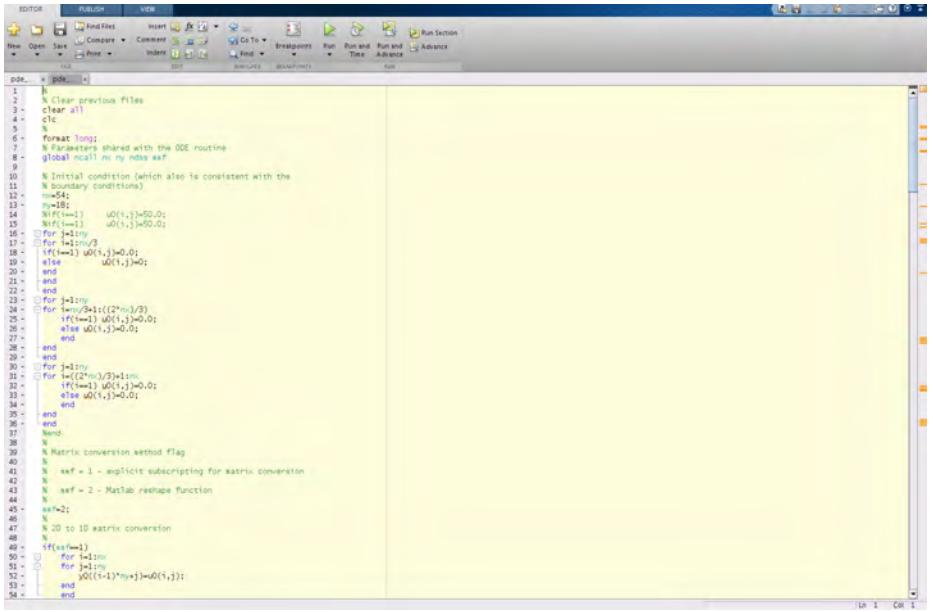


Table 1: Model values

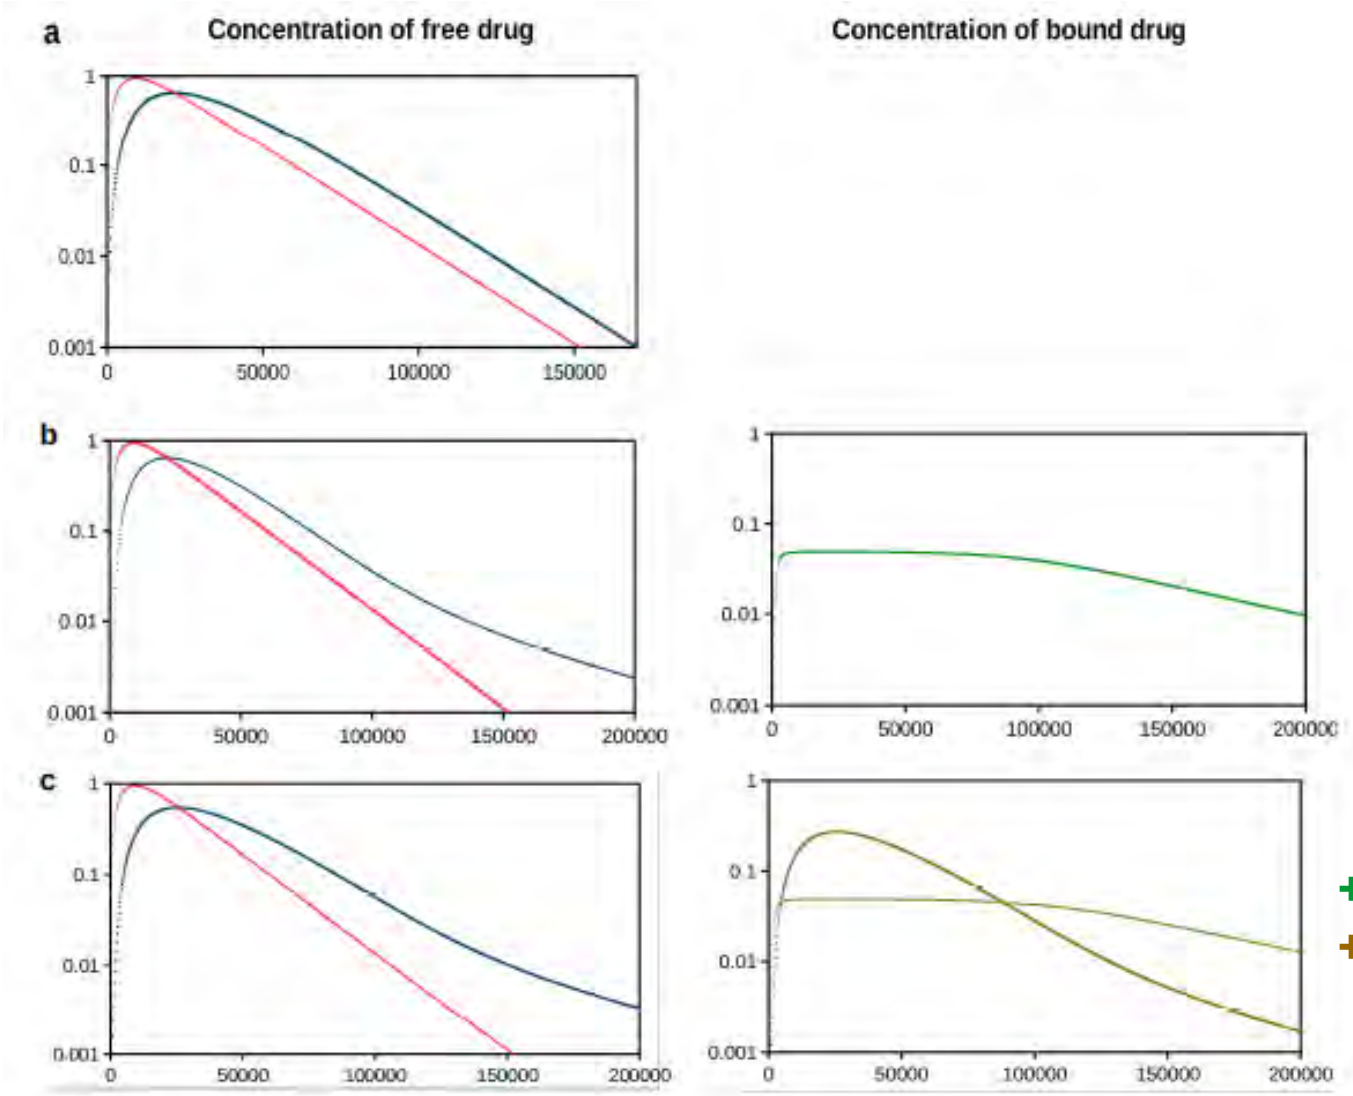
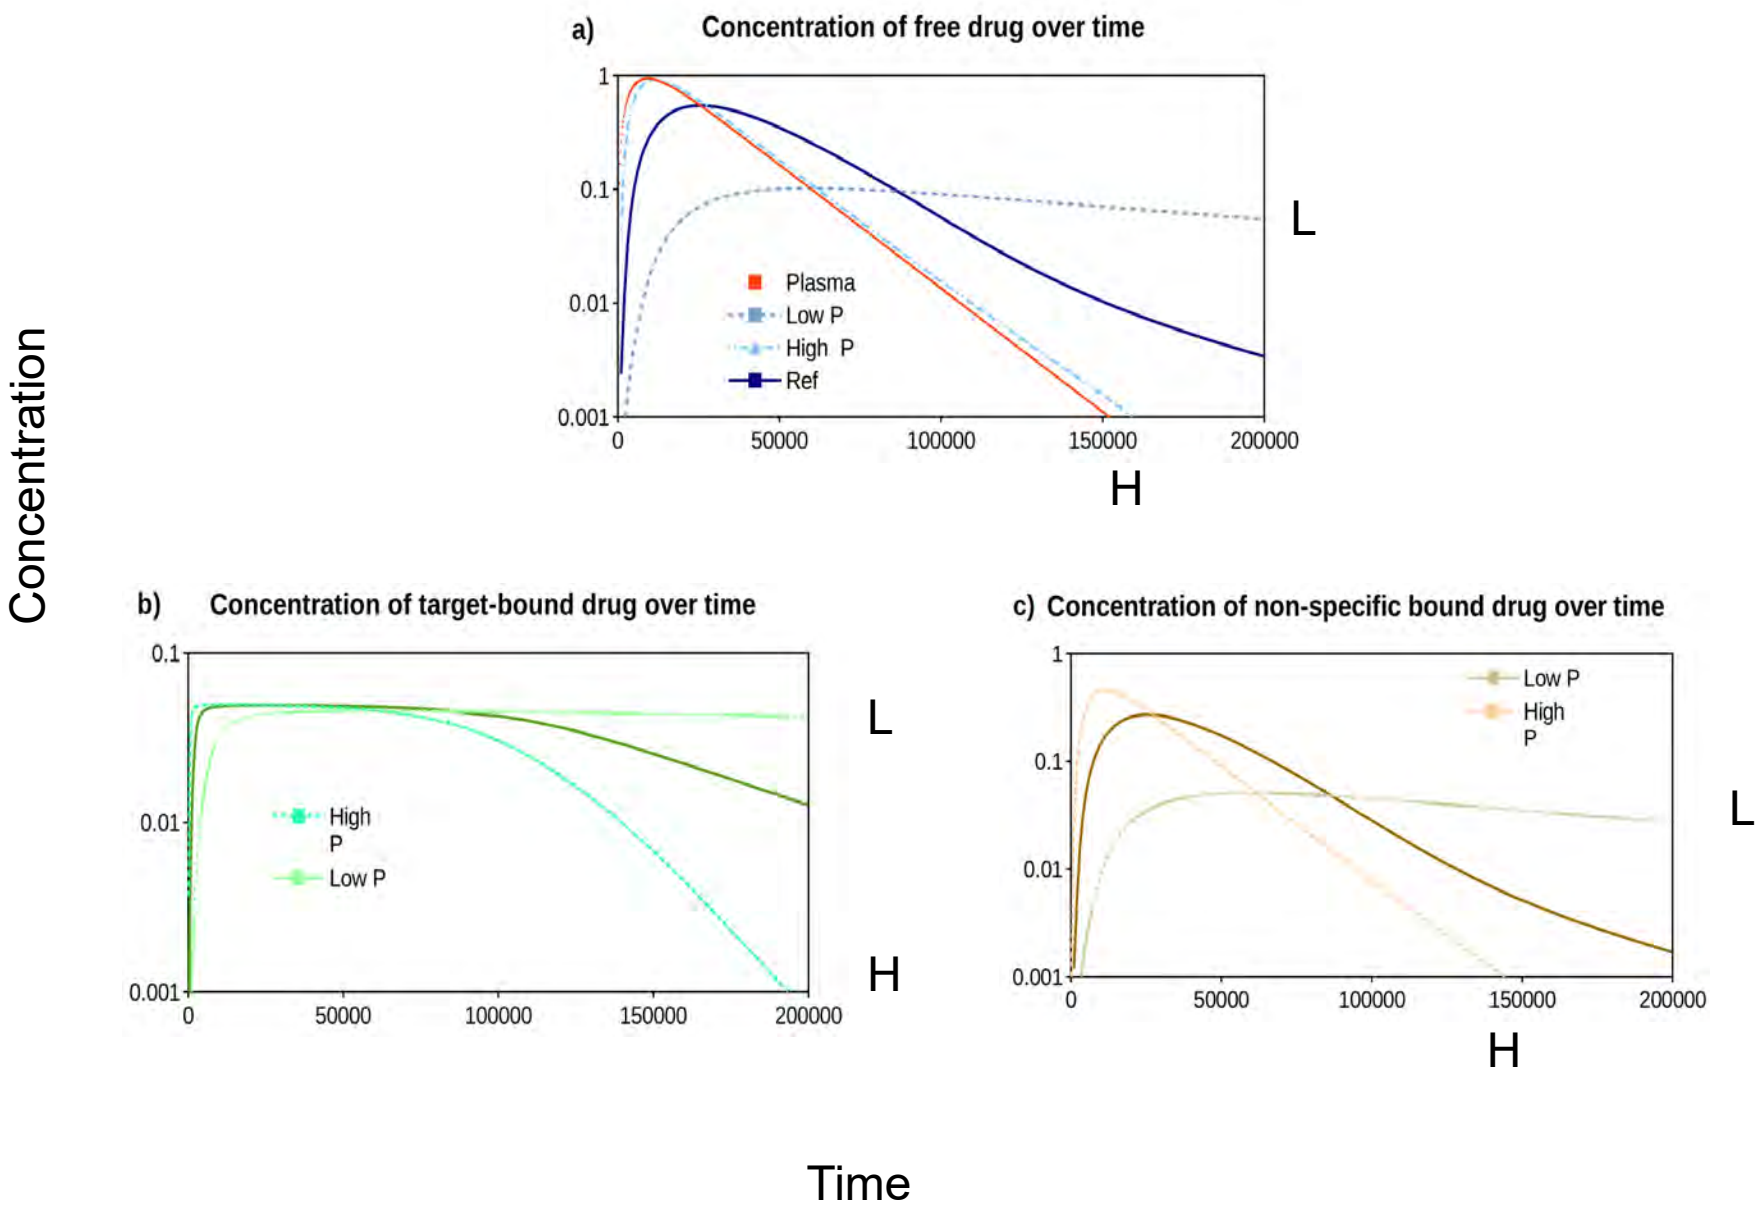
Quantity	Unit	Magnitude	References
Time(t)	s	1	-
Distance(x)	m	$50 \cdot 10^{-6}$	[9, 26, 29, 18, 6]
Distance(y)	m	$50 \cdot 10^{-6}$	[9, 26, 29, 18, 6]
Concentration in ECF (C_{ECF}(x,y,t))	μM	0-100	[22]
Diffusion coefficient (D)	$m^2 s^{-1}$	0.1 - $1 \cdot 10^{-10}$ (0.5)	[17]
Tortuosity (λ)	-	1.44 - 3.5	[17, 15]
Flow velocity (v)	ms^{-1}	0.05-5 $\cdot 10^{-6}$	[23]
Concentration in plasma (C_{pl})	μM	0-100	[22]
Permeability (P)	ms^{-1}	0.1-1000 $\cdot 10^{-}8$	[32]
Total concentration receptors(B_1^{max})	μM	0.001-0.5	[31]
Receptor association constant (k_{1on})	$\mu M^{-1} s^{-1}$	10^{-1} - 10^{3} (10^{0})	[31]
Receptor dissociation constant (k_{1off})	s^{-1}	10^{-6} - 10^{-2}	[31]
Total non-specific binding sites (B_2^{max})	μM	1-500	[30, 10, 11]
NS association constant (k_{2on})	$\mu M^{-1} s^{-1}$	10^{-5} - 10^{1}	[10]
NS dissociation constant (k_{2off})	s^{-1}	10^{0}	[10]
Bioavailability (F)	-	0-1	[22]
Dose	μmol	0.1-5000	[22]
Absorption rate constant (k_a)	s^{-1}	0-2 $\cdot 10^{-3}$	[22]
Elimination rate constant (k_e)	s^{-1}	0.1-5 $\cdot 10^{-3}$	[22]

Influence of drug binding



Influence of permeability



Universiteit Leiden

Spatial distribution

Universiteit Leiden

Spatial distribution - Free drug in the ECF

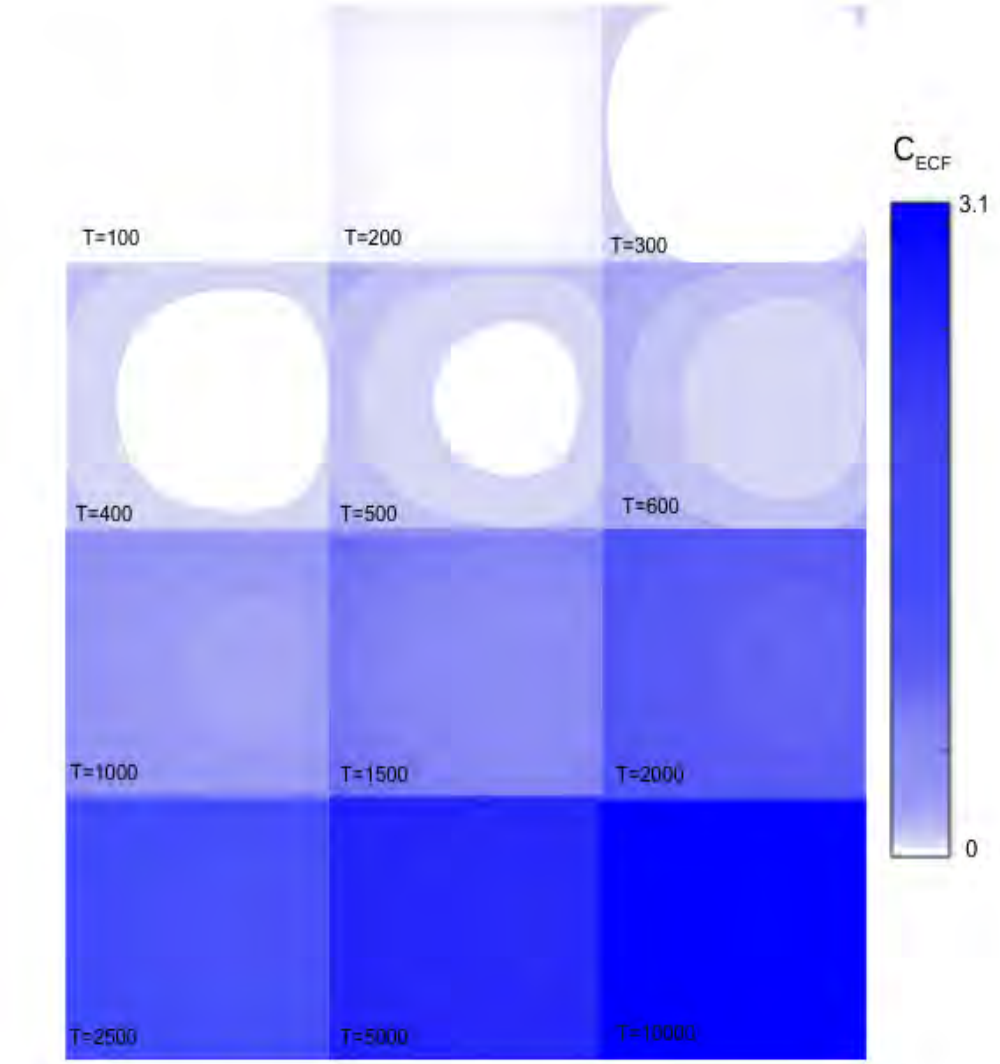


Fig. 7: **Spatial distribution of free drug in the ECF (C_{ECF}).** The concentration time profile of C_{ECF} is shown including the local distribution of C_{ECF} within one unit. The concentration is indicated by the shades of the color bar. The concentration at the top of the color bar is the peak concentration of the simulation.

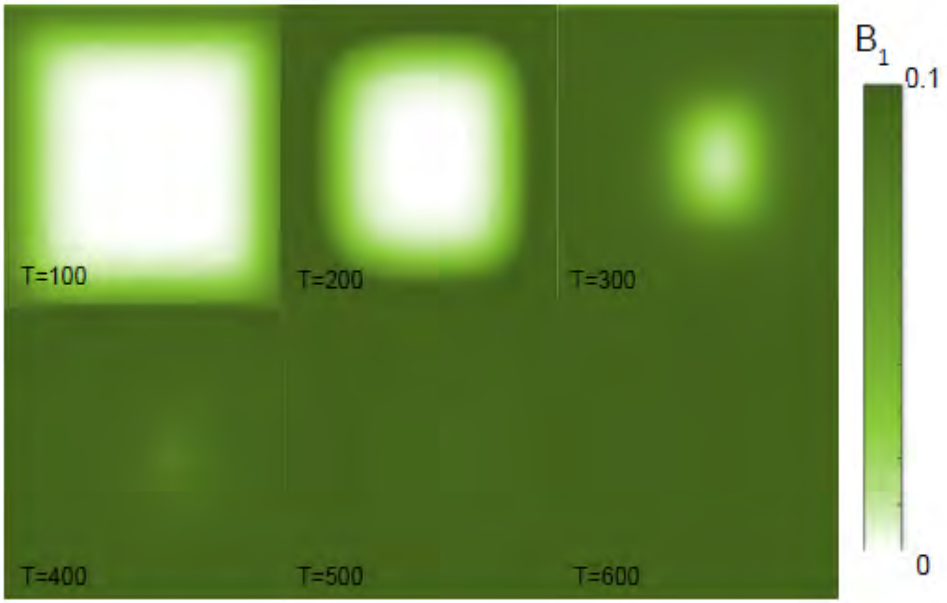
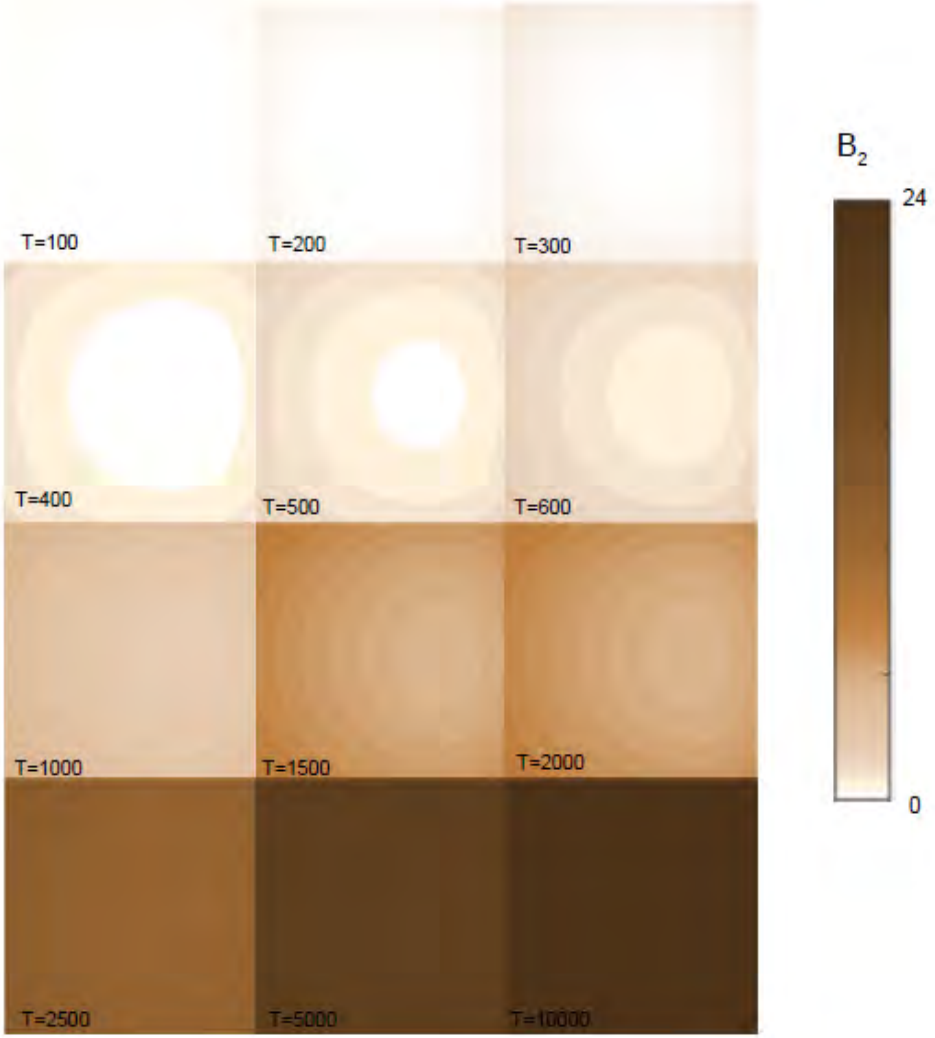
Universiteit Leiden

Spatial distribution – Bound drug in the ECF

Specific-bound drug



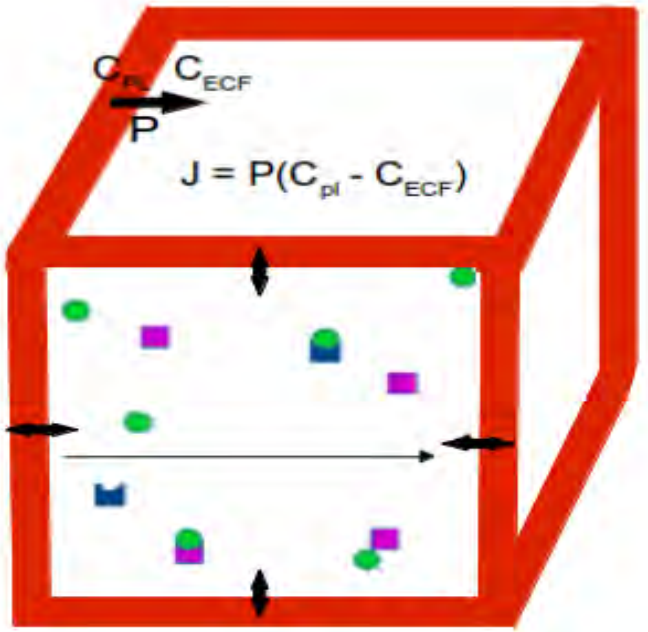
Non-specific bound drug



Next steps and future

- Get into 3D!

- Extend the **permeability** with additional info:
  - distinction between paracellular and transcellular transport
  - distinction between passive and active transport



- **Ultimate aim:** integrate both drug distribution and target interaction kinetics
  - in a 3D manner to improve the prediction of drug action in the brain
